# Why Memory Matters

**A simple problem**

假如我有一张 80GB 的显卡，我想训练/推理一个 4B 的模型，我应该设置多大的 batch size 和 sequence length?

在这个 tutorial 中，我们将基于这个问题来进行思考和分析。我们考虑更一般的问题形式：

**Motivation**

在训练和推理时 LLM 所需要的内存是多少？如何进行优化内存占用？

我们将先介绍训练/推理阶段的内存计算，再针对可优化部分进行分析并介绍相应优化算法。

# Transformer Architecture

以 Qwen3[YLY+25] 为例，现代 LLM 的架构如右图所示。其中具体的模块不同的模型可能有改动。

图: Architecture of Qwen3

# Notation

与参数量、FLOPs 计算所用记号一致；参数量 $P$ 的推导见 LLM parameter analysis。

| 变量 | 含义 |
|---|---|
| $P$ | number of parameters |
| $L$ | layers |
| $V$ | vocabulary size |
| $d$ | hidden size |
| $d_{\mathrm{ff}}$ | FFN hidden size |
| $s$ | sequence length |
| $b$ | batch size |
| $h$ | number of attention heads |
| $d_h$ | attention head dimension |

# Assumption

1. 若无特别说明，使用 **BF16/FP16**，每个参数 $2$ byte。
2. 不使用 dropout（与现代大模型设定一致）。
3. Attention 基于原始 multi-head attention.
4. FFN 基于 SwiGLU.

# Training Memory Componenets

训练部分的内存占用由四部分组成，如下所示

$$
\begin{aligned}
\text{training_memory} &= \text{weight} && (1)\\
&+ \text{activation} && (2)\\
&+ \text{optimizer} && (3)\\
&+ \text{gradient} && (4)
\end{aligned}
$$

**Weights**: $\boxed{2P}$.

**Gradients**（与权重同精度）: $\boxed{2P}$.

# Optimizer states

**AdamW 优化器**：

- **一阶动量**：$2P$,
- **二阶动量**：$2P$,
- **合计**：$2 \times 2P = \boxed{4P}$.

**Algorithm 1:** AdamW[LH19]

**Input:** $\alpha,\ \lambda,\ \beta_1, \beta_2 \in [0, 1),\ \epsilon,\ \theta_0$

**Output:** $\theta_t$

$m_0 \leftarrow 0,\ v_0 \leftarrow 0,\ t \leftarrow 0;$

**while** *Not converge* **do**

$t \leftarrow t + 1;$

$g_t \leftarrow \nabla_\theta f_t(\theta_{t-1});$

$m_t \leftarrow \beta_1 \cdot m_{t-1} + (1 - \beta_1) \cdot g_t;$

$v_t \leftarrow \beta_2 \cdot v_{t-1} + (1 - \beta_2) \cdot g_t^2;$

$\hat{m}_t \leftarrow \frac{m_t}{1-\beta_1^t};$

$\hat{v}_t \leftarrow \frac{v_t}{1-\beta_2^t};$

$\theta_t \leftarrow \theta_{t-1} - \alpha \left( \frac{\hat{m}_t}{\sqrt{\hat{v}_t} + \epsilon} + \lambda \theta_{t-1} \right);$

# Activation

## Motivation

激活值是前向传播过程中计算得到的中间结果，用于在反向传播时计算梯度。

我们仅针对 linear layer 进行推导

$$\text{forward} \qquad \mathbf{z}_\ell = W_\ell \mathbf{a}_{\ell-1} + b_\ell, \quad \mathbf{a}_\ell = \phi(\mathbf{z}_\ell)$$

$$\text{backward} \qquad \frac{\partial \mathcal{L}}{\partial W_\ell} = \frac{\partial \mathcal{L}}{\partial \mathbf{z}_\ell} \cdot \frac{\partial \mathbf{z}_\ell}{\partial W_\ell} = \frac{\partial \mathcal{L}}{\partial \mathbf{z}_\ell} \boxed{\mathbf{a}_{\ell-1}}$$

可以看到，计算第 $\ell$ 层关于 $W_\ell$ 的梯度时需要其输入 $\mathbf{a}_{\ell-1}$，因此训练时需保存每个模块对应的输入，也就是激活值 (activation).

# Activation-Attention

按计算图（无优化）可得需保存的激活：

- Q/K/V 投影：共享输入 $\to 2bsd$
- $Q^\top K$：$Q, K$ 均需保存 $\to 2 \times 2bsd = 4bsd$
- softmax 输入：$2bhs^2$
- weighted sum 输入：$2bhs^2 + 2bsd$
- output projection 输入：$2bsd$

**Attention 合计**：$\boxed{10sbd + 4bhs^2}$.

# Activation-FFN & LayerNorm

**FFN**（SwiGLU，assume $d_{\mathrm{ff}} = 4\,d$）:

- 第一层输入 $2\,sbd$
- SwiGLU 输入 $2 \times d_{ff} \times d = 8\,sbd$
- 第二层输入 $2 \times d_{ff} \times d = 8\,sbd$
- 合计：$\boxed{18sbd}$

**LayerNorm**：保存输入 $\rightarrow$ $\boxed{2bsd}$.

# Activation-Output

**Output** 包含以下组成部分：

- **FinalNorm** 输入：$2bsd$
- **lm_head** 输入：$2bsd$
- **Loss** 输入：$2bsV$

合计：$\boxed{4bsd + 2bsV}$。

# Activation-Total

我们将上面的结果汇总在一起，得到[1]

$$
\begin{aligned}
\text{activation} &= L \cdot \text{transformer_block} + \text{output} && (5)\\
&= L \cdot (\text{Pre_Norm} + \textit{Attention} + \text{Post_Norm} + \text{FFN}) + \text{output} && (6)\\
&= \boxed{bs(32dL + 4hsL + 4d + 2V)} && (7)\\
&\approx bsL(32d + 4hs) && (8)\\
&\approx 4bs^2hL && (9)
\end{aligned}
$$

我们可以看到，未优化的情况下，$\text{activation} \propto bs^2$. 这里 $s^2$ 主要由 attention 部分产生，后续 flash attenion 就针对这一点进行了优化。

[1] Qwen3 中，$2V/32dL = 6\%$, $32dL/4hsL = 2.5\%$.

# Total Training Memory

我们将上面的结果进行汇总得到

$$
\begin{aligned}
\text{training_memory} &= \text{weight} + \text{activation} + \text{optimizer} + \text{gradient} && (10)\\
&= 2P + bs(32dL + 4hsL + 4d + 2V) + 4P + 2P && (11)\\
&= 8P + bs(32dL + 4hsL + 4d + 2V) && (\text{exact})\\
&\approx 8P + 4bs^2hL && (12)
\end{aligned}
$$

可以看到，训练阶段的内存占用分为固定部分 ($8P$) 和动态部分 ($4bs^2hL$)，动态部分主要是 attention 的缓存。

# Analysis

我们以 Qwen3 模型为例，得到如下热力图，batchh size 越小，说明 activation 占用越高

图: Comparison of activation memory with fixed memory

# Experiments

我们分别针对 80GB 的显卡计算 Qwen3 系列模型的最高配置：

| Model | $P$ | $L$ | $h$ | $s$ | predicted $b$ | actual $b$ |
|---|---|---|---|---|---|---|
| Qwen3-0.6B | 0.6 | 28 | 16 | 512 | 68 | 34 |
| Qwen3-1.7B | 1.7 | 28 | 16 | 512 | 42 | 28 |
| Qwen3-4B | 4 | 36 | 32 | 512 | 16 | 12 |
| Qwen3-8B | 8.1 | 36 | 32 | 512 | 4 | 2 |

其中 predicted $b$ 基于前面的准确公式计算得到；actual $b$ 通过实验验证得到。（注意我们这里的 prediction 没有考虑任何优化手段与其他内存开销，因此与实际值有出入）

# Case Study

我们分别使用 Qwen3-4B 和 Qwen3-8B 来进行实验 ($b = 1$, $s = 512$), 结果如下[2]

图: Memory profile of Qwen3-8B

图: Memory profile of Qwen3-4B

# Inference Components

Inference 阶段内存占用主要与模型参数，KV cache 两部分相关。

$$\text{Inference_Memory} = \text{weight} \tag{13}$$
$$+ \text{activation} \tag{14}$$
$$+ \text{KV cache} \tag{15}$$

- Weights：$\boxed{2P}$
- Activations（经验[3]，batch size=1）：$\approx 0.4P$
- KV cache：与序列长度相关，见后续分析。

[3] 见 https://blog.eleuther.ai/transformer-math/

# KV Cache Mechanism

## Motivation

LLM 推理中为避免重复计算历史 token 的 key/value 而使用的**空间换时间**的缓存机制。

自回归时逐 token 生成，每步 attention 形式为（$\mathbf{q}_t$ 当前 query，$\mathbf{k}_{:,t}/\mathbf{v}_{:,t}$ 历史 K/V）：

$$\mathbf{q}_t = W_Q\mathbf{x}_t, \quad \mathbf{k}_{:,t} = W_K[\mathbf{x}_1, \ldots, \mathbf{x}_t], \quad \mathbf{v}_{:,t} = W_V[\mathbf{x}_1, \ldots, \mathbf{x}_t]$$

处理下一 token $\mathbf{x}_{t+1}$ 时只需在已有结果后追加当前步：

$$\mathbf{k}_{:,t+1} = W_K[\mathbf{x}_1, \ldots, \mathbf{x}_{t+1}] = [\mathbf{k}_{:,t},\ W_K\mathbf{x}_{t+1}], \quad \mathbf{v}_{:,t+1} = W_V[\mathbf{x}_1, \ldots, \mathbf{x}_{t+1}] = [\mathbf{v}_{:,t},\ W_V\mathbf{x}_{t+1}]$$

缓存前，每生成一个 token 都重新计算 $\rightarrow$ 总计算量 $\sum_{t=1}^{s} \mathcal{O}(t) = \mathcal{O}(s^2)$；

缓存后，每步只算当前 token $W_K\mathbf{x}_{t+1}$、$W_V\mathbf{x}_{t+1}$ $\rightarrow$ 计算量 $\mathcal{O}(s)$、空间占用 $\mathcal{O}(s)$ ——**以空间换时间**。

# KV Cache Memory

对于 multi-head attention ，KV cache 的显存占用为：

$$\text{Memory(KV cache)} = s \times 2 \times 2 \times L \times h \times d_h = \boxed{4sLhd_h} \tag{16}$$

**因子含义**： $s$ 序列长，2 为 K+V, $L$ 层、$h$ 头、$d_h$ 头维度。

**Remark**

- KV 占用与**模型配置**（$L, h, d_h$）和**序列长度** $s$ 都有关，token 越多占用越高。
- 实际中因 *page granularity*、*padding*、*fragmentation* 往往略高于理论值。
- 长输出时 KV 占比会超过权重，成为推理瓶颈 → 见后续「KV Cache 优化」。

# Inference Memory

综合前面分析，我们可以得到推理阶段的总内存为：

$$\boxed{\text{Inference_Memory} \approx 2.4P + 4sLhd_h}$$

可以看到，推理阶段也由固定部分（参数量，activation）以及动态部分（KV cache）组成。

# Experiments

我们仍然使用 Qwen3 系列来进行实验（未考虑任何优化，仅考虑 KV cache 和 prefilling），结果如下：

图: Memory profile for Qwen3 series

注意这里的 peak memory 实际上并不能和 KV cache 的显存占用完全对应，因为 peak memory 还包括了 attention 的临时显存等。

# Dynamic v.s. Static

接下来我们看一下模型权重与 KV cache 的显存占用情况。由于 Qwen3 的 KV cache 计算为 $4sLh_{kv}d_h$，而不同模型只有 $L$ 不一样，因此对于更大的模型，KV cache 显存占用超过模型权重的上下文长度更高。

图: Dynamic vs. Static memory profile for Qwen3 series

# Overview

| 阶段 | 核心方法 | 典型技术 |
|---|---|---|
| Training | 显存与效率提升 | Activation Checkpointing<br>Mixed Precision Training<br>Flash Attention<br>ZeRO<br>Pipeline/Model/Data Parallelism |
| Inference | 长序列与速度优化 | KV Cache Optimization<br>Paged/Radix Attention<br>Faster Attention<br>Quantization |

# Mixed Precision Training

## Motivation

计算量大的部分用低精度，计算量小的部分用高精度。低精度参与运算，高精度避免 Overflow/Underflow.

下图是 DeepSeek-V3[DALF+25] 使用的混合精度训练框架

图: Mixed precision training of DeepSeek-V3

# ZeRO[RRRH20a]

## Motivation

将 optimizer states / gradients / weights 按不同 GPU 切片存储，需要参与计算时再 all-gather 整合成完整参数。这样每张卡只需维护自己负责的一部分，大幅降低单卡显存需求。

ZeRO 的工作原理如下图所示

图: ZeRO DP framework

# ZeRO Stages

- **ZeRO1**: shard optimizer states

$$\text{Training_Memory} = \text{weight} + \text{activation} + \frac{\text{optimizer}}{\#\text{GPUs}} + \text{gradient} \tag{ZeRO1}$$

- **ZeRO2**: shard gradients + gradients

$$\text{Training_Memory} = \text{weight} + \text{activation} + \frac{\text{optimizer} + \text{gradient}}{\#\text{GPUs}} \tag{ZeRO2}$$

- **ZeRO3**: shard all

$$\text{Training_Memory} = \text{activation} + \frac{\text{weight} + \text{optimizer} + \text{gradient}}{\#\text{GPUs}} \tag{ZeRO3}$$

**Remark**

ZeRO3 可极大降低单卡显存上限，但通信量也会提高。

# Model Parallelism[SPP+20]

## Motivation

将模型切分到不同的 GPU 上，计算时，先 dispatch, 再执行计算，最后通过 all-gather 等操作得到最终结果。切分方式包括 PP (Pipeline Parallelism), TP (Tensor Parallelism), EP (Expert Parallelism) 等。

$$\text{Training_Memory} = \frac{\text{Memory(weight)}}{\text{PP degree} \times \text{TP degree}} \tag{17}$$

结合 ZeRO1 与 Model Parallelism 时（activation 中与 TP 相关的部分按 TP degree 缩减）:

$$\text{Memory}_{\text{train}} \approx \frac{\text{weight}}{\text{PP} \times \text{TP}} + \frac{\text{activation}}{\text{TP}} + \frac{\text{optimizer}}{\#\text{GPUs}} + \frac{\text{gradient}}{\text{PP}}$$

# Activation Checkpointing[KCL+22]

## Motivation

在反向传播时，重新计算所需的输入，来达到以时间换空间的目的。

| | No ckpt | Selective ckpt | Full ckpt |
|---|---|---|---|
| memory | 很高 | 中等 | 很低 $\sim 2bsd$ |
| extra compute | 无 | 中等 | 很高 $\sim 2Pbs$ |

## Remark

实践中常结合 model parallelism 与 selective checkpointing 来实现 trade off.

# Flash Attention[DFE+22]

## Motivation

通过将 Attention 的计算进行分块，来提高内存访问效率以及降低反向传播时所需要的 activation 大小。

**Flash Attention** 通过 tiling 与 online-softmax 降低该部分显存并提升效率[4]。这样 attention 部分的显存就由 $\text{activation} \propto bs^2$ 降低到了 $\text{activation} \propto bs$.

## Theorem

flash attention 输出 $O = \mathrm{softmax}(QK^T)V$ (correctness).
其时间复杂度为 $\mathcal{O}(s^2 d)$, 空间复杂度为 $\mathcal{O}(s)$ (memory savings).

[4]详见 notes on Flash Attention

# KV Cache Optimization[LLT+25]

$$\text{Memory(KV cache)} = s \times 2 \times 2 \times L \times h \times d_h$$

1. $s$: KV cache compression, eviction, selection
2. $2$: KV cache quantization
3. $2$: key-value sharing, MLA[DALF+24]
4. $h \times d_h$: attention, MQA[Sha19], GQA[ALTdJ+23], MLA.

# Weight Quantization

## Motivation

使用低精度来表示高精度数值的方法，来减少内存占用/提高计算效率。

| 量化时机 | 代表性工作 |
|---|---|
| 训练后量化 (PTQ) | GPTQ[FAHA23]<br>AWQ[LTT+24]<br>SmoothQuant[XLS+24]<br>GGUF[Ger23] |
| 量化感知训练 (QAT) | LLM-QAT[LOZ+23]<br>PEQA[KLK+23] |

表: 大模型量化方法总结

# Activation Offloading

## Motivation

将一部分参数/优化器状态/激活值等存储到 CPU 上，需要的时候再加载到 GPU 上。

| Offloading 场景 | 代表性工作 |
|---|---|
| 训练阶段 Offloading | ZeRO-Offload[RRA+21] / ZeRO-Infinity<br>FSDP[ZGV+23] CPU Offload |
| 推理阶段 Offloading | FlexGen[SZY+23]<br>vLLM[KLZ+23] KV Cache Offload |

# Takeaway

| Components | Training | Inference | Optimization |
|---|---|---|---|
| weights | $2P$ | $2P$ | quantization |
| optimizer states | $12P$ | 0 | ZeRO, offloading |
| gradients | $2P$ | 0 | ZeRO |
| activations | $\sim 4Lhs^2b$ | $\sim 0.4P$ | ckpt, offloading, flash attention |
| KV cache | 0 | $4sLhd_h$ | kv optimization, attention |
| TOTAL | $16P + 4Lhs^2b$ | $2.4P + 4sLhd_h$ | |

- **训练**：瓶颈主要在激活值（随 batch size / 序列长度线性增长）。
- **推理**：瓶颈主要在 KV Cache（随序列长度增长）。

# Conclusion & Future Directions

## Conclusion

We discussed how to analyze the memory occupied by an LLM and how to optimize it.

## Future Directions

1. More efficient architecture (attention, MoE).
2. Scalable training/inference framework
3. Software-hardware co-design algorithms.
